regulation of cell cycle progession.
--- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
--- TISSUE SPECIFICITY: High levels in cerebellum, thymus, spleen and prostate. Low levels in skeletal muscle.
--- DEVELOPMENTAL STAGE: Expression levels increase through the cell cycle to peak in the mid/late-S phase and decrease during G2/M
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          31 VRKMPSNQN-VSPSQRDEVIQWLAKLKYQFNLYPETFALASSLLDRFLATVKAHPKYLSC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LAMVSLEMEKLIPDWLSLTIELLQ-----KAQMDSSQLIHCRELVAHHLSTLQS 252

Human cyclin.I protein and related (anti:sense) DNA - used for neuron labelling method and cancer cell detection.

Claim 1; Fig 1; 45pp; Japanese.

This sequence is human cyclin I. Antisense polymucleotides are useful for as probes and can be labelled and used for detection of neurones by hybridisation with mRNA for cyclin I (contained in the neurones and arising by the expression of the cyclin I gene in these cells). The gene can be used for detection of cancer cells by detecting the expression of the cyclin I gene in these cells. Also antibodies specific for the fragments of the protein (especially AAW21966) can be used for detection

```

This is the human Cyclin I amino acid sequence. Cyclin I is expressed at almost constant levels throughout the cell cycle, and is implicated in controlling cell cycle progression and transcriptional control. Cyclins form complexes with cyclin-dependent kinases. CDK2, cyclin-dependent kinase 2, is used in the invention which relates to complexes of the CDK2 protein with other proteins, selected from cyclin I, ERH, haReq, hsReq*-1 and hsReq*-2 (AAY52185-Y52188). CDK2 is expressed late in G or early in S phase of the cell cycle, and is pivotal for G1/S transition.

```
Compositions containing a CDK2 complex, an antibody targeting the complex, and mucleotide sequences encoding CDK2 or its derivatives can be used therapeutically. The complexes and their nucleotide sequences can be used to treat diseases or disorders associated with increased or decreased levels of the complex. Screening the complex, or a derivative or a modulactor of the complex for neoplastic activity by measuring the cortact with the complex for neoplastic activity by measuring the contact with the complex and be used to indicate if the the complex has anti-neoplastic activity. Screening for molecules that modulate the complexes can be used for treating or preventing attention of the complexes can be used for treating or preventing attention of the complexes can be used for treating or preventing attention of the complexes the unital treating or attention of the complexes to the tunned disease which can be treated or prevented by molecule/s which modulate the function of the complex include cancer, hyperproliferative disorders and atherosclerosis

                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, xenotransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or thugal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                  The invention relates to prostate selective polynucleotides and polypeptides. The polynucleotides are expressed in prostate and are useful as molecular markers, as drug targets, and for detecting, monitoring, preventing or treating diseases and conditions related to prostate, such as prostate cancers. The present sequence represents a prostate polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MKFPGPLENQRLSFLLEKAITREAQMWKVNVRKMPSNQNVSPSQRDEVIQWLAKLKYQFN

```

```
The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in nammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host cells comprising a TAT nucleic acids and polypeptide; and methody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LYPETFALASSLLDRFLATVXAHPXYLSCIAISCFFLAAKTVEEDERIPVLKVLARDSFC 120

                                               death (CGDD) proteins and polynucleotides encoding them. The sequences of the invention are useful in diagnosing, preventing and treating disorders associated with an abnormal expression or activity of CGDD such as neurodegenerative disorders (e.g. Parkinson's disease, Alzhaimer's disease), muscular disorders (e.g. myotonic dystrophy, catatonia), endocrine disorders (e.g. diabetes, Grave's disease), cancers (e.g. leukaemia, cervical or breast cancers), immunological disorders (e.g. leukaemia, cervical or breast cancers), immunological disorders (e.g. scleroderma, systemic lupus erythematosus, allergies), gastrointestinal disorders (e.g. Crohn's disease), renal disorders (e.g. doodpasture's syndrome), infections (e.g. viral, bacterial, fungal, parasitic, and hepatic diseases (e.g. cirthosis). The polynucleotides can be used to create humanised animals or transgenic animals to model human diseases.

The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of CGDD, such as: cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, bursitis, cirrhosis, hepatitis, polycythaemia vera, psoriasis and cancers), developmental disorders (e.g. Cushing's syndrome and hypothyroidism), neurological disorders (e.g. epilepsy, stroke, Alzheimer's disease, plck's disease, Huntington's disease, Parkinson's disease and multiple sclerosis), autoimmune/inflammatory disorders (e.g. AlDS, allergies, anaemia, asthma, contact demantitis and diabetes mellitus), and reproductive disorders (e.g. infertility, endometriosis and uterine fibroid). The present amino acid sequence represents a human CGDD-associated protein of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a polypeptide encoded by one of a large number of 5' ESTB derived from mRNAs encoding secreted proteins. The 5' ESTB were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranalated region (UTR) of the mRNA because they are often obtained from oligo-dr perimed cDNA libraries. Such ESTB are not well suited for isolating cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTB are derived from mRNAs and even in those cases where therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTB are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of involving aberrant protein expression or biological activity. The diagnostics, forensics, gene mapping, identification of mutations in diagnostics, forensics, gene mapping, identification of mutations in cativity for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic directly electronic sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to cDNA clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antibodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the cDNA molecules. As such, these molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Alzheimer's

The present invention relates to methods for identifying genes and proteins that are implicated in a specific disease or physiological condition. The method comprises comparing the transcriptome/proteome of a specialised cell type implicated in a disease or condition with that of a second specialised cell type implicated in a disease or condition with that of a second specialised cell type under two experimental conditions, and identifying a gene that is differentially regulated in the two specialised cell types under experimental conditions. ABV7813-ABV78116 and ABP65061-ABP65257 were identified using the methods of the invention. The coding sequences and proteins are useful for treating adsease in a patient, for manufacture of a medicament for treating hypoxia-regulated conditions, and for regulating tumourigenesis, angiogenesis, apoptosis, biological response to hypoxia conditions, or hypoxic associated cancer, isotament of a disease or physiological for monitoring the therapeutic treatment of a disease or physiological condition, such as cancer, ischaemic conditions, repertuasion injury, retinopathy, neonatal stress, preeclapmest, atherosclerosis, inflammatory conditions, wound healing, inflammation, erythropoiesis or hair loss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; PRO; immune related disorder; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; juvenile chronic arthritis; systemic sclerosis; Siggren's syndrome; vasculitis; sarcoidosis; autoimmune haemolytic anaemia; autoimmune thrombocytopenia; thyroiditis; diabetes mellitus; renal disease; demyelinating disease; central nervous system; peripheral nervous system;
                                                                                                                                      polypeptide comprising an amino acid sequence which is part or all of cyclin G2 and comprising an amino acid sequence which is part or all of consists of an amino acid sequence from which 1 or more amino acid is deleted, substituted or added in this amino acid sequence and has an apoptosis induction activity. The polypeptide of the invention demonstrates cytostatic activity and may be useful for screening antineoplastic drugs, as well as for treating cancer. The current sequence is that of the human cyclin G2 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   31 VRKMPSNQN-VSPSQRDEVIQWLAKLKYQFNLYPETFALASSLLDRFLATVKAHPKYLSC

                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogran's syndrome, vasculitis, sarcoidosis, systemic haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating diseases of the Guillain-Barre syndrome and chronic inflammatory demyelinating.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31 VRKMPSNON-VSPSQRDEVIQWLAKLKYQFNLYPETFALASSLLDRFLATVKAHPKYLSC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               human; PRO; immune related disease; inflammatory immune response; immune response stimulation; antiallergic; antianaemic; antiarthritic; antiathmatic; antidiabetic; antiallergic; antiamatory; antipsoriatic; antithyroid; CNS; dermatological; gastrointestinal; antirheumatic; antithyroid; immunostimulant; immunosuppressive; muscular; nephrotropic; neuroprotective; osteopathic; respiratory; vasotropic; virucide; gene therapy.
                                                                                                                                                                                                                                                                                                                        The invention relates to human PRO polypeptides and the polynucleotides encoding them. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic arthritis, sacologis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the

The present invention describes an isolated PRO nucleic acid (I). Also described: (1) a vector comprising (I); (2) a host cell comprising the vector of (1); (3) a process for producing a PRO polypeptides; (4) an isolated PRO polypeptide; (5) a chimeric molecule comprising the polypeptide of (4) fused to a heterologous amino acid sequence; (6) an antibody which specifically binds to a polypeptide of (4); an agonist or antibody which specifically binds to a polypeptide of (4), an agonist or composition of matter comprising a polypeptide of (4), an agonist or antibody which specifically binds to a polypeptide of (4), an agonist or comprising a container, a label on the container and a composition of matter of (7); (9) a method of treating an immune related disease in a mammal; (10) a method for determining the presence of a PRO polypeptide or an aspaple suspected of having the polypeptide; (11) a method of identifying a compound that inhibits or chimacs the activity of or expression of a gene encoding a PRO polypeptide; in a mammal; (12) a method of stimulating the immune response in a mammal. The PRO sequences have antiallargic, antianaemic, antiarthritic, antithyroid, CNS, dermatological, gastrointestinal, cantinty and can gene encoding a PRO polypeptide or antianaemic, antiatrhitics, antithyroid, cNS, dermatological, gastrointestinal, cantinty and can be used in gene herapy. The nucleic acid virucides activities, and can be used in gene herapy. The nucleic acid contained activities, and can be used in gene herapy. The nucleic acid contained activity descreptions, kits and methods are useful in diagnosing and treating an immune related disease and in process to a mimmune response. The present sequence represents a human contained through an immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                            New PRO polynucleotides and polypeptides, useful in useful in diagnosing and treating an immune related disease, e.g. systemic lupus erythematosus, rheumatoid arthritis, diabetes mellitus or asthma and in
                                                                                                                                                                                                                                                                                                         Schoenfeld J, Williams PM;

```
an Cyclin I nucleotide sequence. Cyclin I is ant levels throughout the cell cycle, and is yell cycle progression and transcriptional pulsaes with cyclin-dependent kinases. CDK2, is used in the invention which relates to been with cyclin-dependent kinases. CDK2, is used in the invention which relates to cother by the complex is selected from cyclin has have 2 (AAY52185-Y52188). CDK2 is expressed phase of the cell cycle, and is pivotal for G1/S containing a CDK2 complex, an antibody targeting de sequences encoding CDK2 or its derivatives lasses or disorders associated with increased or complex. Screening the complex, or a derivative mplex for neoplastic activity by measuring the of cells from a malignant cell line when in can be used to indicate if the the complex has screening for molecules that modulate the complex is can be used for tracting or preventing sclenosis—associated disease by contacting cells in which tumour growth or regression is measured blastic activity is displayed. Diseases which can hyperproliferative disorders and atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GGAAAGTGAATGTGCGGAAAATGCCTTCAAATCAGAATGTT 120

The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are codilating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in GS; (2) screening (M3) for an agent capable of modulating GCA or an inflammation (especially chronic) in a cissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression or profile; (3) detecting (M4) an inflammation (especially chronic) in a cissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from GS, where the level of expression in a sample of the tissue of gine(s) from GS, where the level of expression in falsemation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation flor detecting a tissue having inflammation with an agent capable of modulating GCA preferably in an a subject to a pathogen or sterile inflammation in a tissue; M4 is useful for metecting an inflammation in a tissue, M4 is useful for detecting an inflammation in a tissue, M5 is useful for detecting an atissue of a subject to a pathogen or sterile inflammatory disease (e.g. exposure of a subject to a pathogen or sterile inflammatory disease (e.g. exposure of a subject to a pathogen or sterile inflammatory disease, condistribution injury, renal respectivity bowel disease, croph's and architist, splomeration injury, renal respectivity as sthma, thrombosis, cardiac reperfusion injury, renal reperfusion injury, and presented a subject in the pathogen or sterile disease, alceration injury, and inflammatory bowel disease, alcer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  infection, viral infection, parasitic infection, protozoal infection, fungal infection and M5 is useful for treating one of the above conditions. The present sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this patent dinot form part of the printed specification, but was obtained in electronic format directly from WIPO at
Crohn's disease; ulcerative colitis; periodontal disease; granulocyte activation; chronic inflammation; allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vockley
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś

The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by: (1) determining a pattern of expression in the ovarian tumor of several markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-1-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or BRCA-1-like or BRCA-1-like or BRCA-1-like or BRCA-1-like or but end gene having an altered pattern of expression in ovarian cancer -related gene having an altered pattern of expression in ovarian cancer. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by determining a pattern of expression in the ovarian tumor of several markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
Ovarian cancer-related DNA #219 with altered ovarian cancer expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ThrArgGluAlaGlnMetTrpLysValAsnValArgLysMetProSerAsnGlnAsnVal

The invention relates to a composition comprising a plurality of CDNAs for detecting the altered expression of genes in an immunological cresponse. The invention also relates to a method of diagnosing or monitoring the treatment of an immunopathological condition in a sample, comprising obtaining nucleic acids from a sample, contacting the nucleic acids of the sample with an array comprising the plurality of cDNAs under conditions to form one or more hybridisation complexes and comparing the levels of the detected hybridisation complexes with the level of hybridisation complexes with the level of hybridisation complexes orrelates with the presence of an immunopathological condition. Also disclosed are an expression profile comprising a microarray and a plurality of detectable complexes and a method for identifying a plurality of polynucleotide probes: The CDNAs are useful as hybridisable array elements in a microarray can be used in the expression of target polynucleotides. The microarray can be used in conference of an immunopathology, such as Crohn's disease, asthma, other diagnosis of an immunopathology, such as Crohn's disease, asthma, other diagnosis of an immunopathology, such as Crohn's disease, asthma, other diagnosis of an immunopathology, such as Crohn's disease, asthma, other diagnosis of an immunopathology, such as Crohn's disease, asthma, other diagnosis of an immunopathology, such as Crohn's disease, asthma, other diagnosis of an immunopathology, such as crohn's disease, asthma, other diagnosis of an immunopathology, such as crohn an incoarray may and in density and development, toxicological and incoarray and also be used in drug discovery and development, toxicological and incoarray can be used in drug discovery and development, toxicological and incoarray can be used in drug discovery and development of the diseases. The microarray may are also be used in drug discovery and development of the discovery of the coart of the coart of the coart of the coart of the coart of the coart of the coart of
                                                                                                  A composition comprising a plurality of cDNAs, useful for detecting altered expression of genes in an immunological response or for diagnosing and treating an immunopathology, e.g. Crohn's disease, asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       carcinogenicity studies, forensies or pharmacogenomics. The composition may also be used in purification of a subpopulation of mRNAs, cDNAs or spennic fragments. This sequence represents a human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1260 BP; 352 A; 283 C; 274 G; 351 T; 0 U; 0 Other;

o a method of classifying a breast cancer patient by determining the similarity between the level of live genes for which markers are listed in the lample taken from the breast cancer patient, to sain for each respective five genes to obtain a e. The methods are useful for classifying a breast y to prognosis. Kits and computer program products lysis using the diagnostic, prognostic and the invention. This sequence corresponds to a of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LTrpLysvaldsnvaldrgLysMetProSerdsnGlndsnval 40

                       This sequence encodes human cyclin I. Antisense polymucleotides are useful for as probes and can be labelled and used for detection of meurones by hybridisation with mRNA for cyclin I (contained in the neurones and arising by the expression of the cyclin I gene in these cells). The gene can be used for detection of cancer cells by detecting the expression of the cyclin I gene in these specific for the fragments of the protein (especially ANX1966) can be used for detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CTTTACCCAGAAACATTTGCTCTGGCTAGCAGTCTTTTGGATAGGTTTTTAGCTACCGTA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GlyCysSerSerGluIleLeuArgMetGluArg1leIleLeuAspLysLeuAsnTrp
                                                                                                                                                                                                                                                                                                                                     The invention relates to prostate selective polynucleotides and polypeptides. The polynucleotides are expressed in prostate and are useful as molecular markers, as drug targets, and for detecting, monitoring, preventing or treating diseases and conditions related to prostate, such as prostate cancers. Sequences ACC47325-356 represent specific examples of prostate specific polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            200 ATGAAGTTTCCAGGGCCTTTGGAAAACCAGAGATTGTCTTTCCTGTTGGAAAAGGCAATC

and immunostimulatis; and a polypeptide (III) of a ovarian tumour control of the 10912 moleculation of the 10912 moleculate sequences as given in ABL77021 to ABL67934, (III) encoding (II) having a sequence (S1), a T cell population of (II), or antigen presenting cells that express (II). (I) has cytostatic or antigen presenting cells that express (II). (I) has cytostatic cortivity. An oligonuclectide (IV) that hybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contacting a biological sample from a patient with (IV), detecting the amount of polymuclectide hybridising to (IV) and comparing the amount of polymuclectide hybridising to (IV) is detected preferably by colymerses chain reaction (PCX). (I) comprising (III) and/or. (II) is useful for stimulating and/or expanding T cells specific for an ovarian tumour protein comprising contacting T cells with (III) or (II). (III) is useful in design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in tumour cells; and to isolate a full length gene from a suitable library e.g., a tumour colNA library using well known techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GATCTTCACACAGGCCACACTTGGATTTTTTTTTTTTCCATGCCATTGCAGTGTCA 1023

                                                                                        The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic slett, lung, bone marrow or stem cell transplant rejection, respection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple solerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a madNA reference sequence for a So mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1024
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

polypeptides, and their related nucleic acids. The TAT polypeptides are vorexxpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide acquences at least 80% identical to the TAT nucleic acids and polypeptides; expression vectors and host calls comprising a TAT nucleic acid, an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT nucleic acid of the invention
                                                                                                                                                                                                                                                                                             invention relates to human tumour-associated antigenic target

The present invention relates to novel cell growth, differentiation and death (CGDD) proteins and polynucleotides encoding them. The sequences of the invention are useful in diagnosing, preventing and treating disorders associated with an abnormal expression or activity of CGDD such as associated with an abnormal expression or activity of CGDD such as cherrodegenerative disorders (e.g. Parkinson's disease, Alzheimer's disease), muscular disorders (e.g. myotonic dystrophy, catatonia), endocrine disorders (e.g. diabetes, immunological disorders (e.g. lenkaemia, cervical or breast cancers), immunological disorders (e.g. cleroderma, systemic lupus erythematosus, allergies), gastrointestinal disorders (e.g. Crohn's disease), renal disorders (e.g. Goodpasture's syndrome), infections (e.g. viral, bacterial, fungal, parasitic, protozoal, helminthic), cardiovascular disorders (e.g. atherosclerosis)

Tre inhemised animals or transgenic animals to model human diseases.

The invention is also used in gene therapy. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    417

The invention relates to inverte acts which in ormal contains contain cancer cells as compared to their expression in normal (i.e. noncarcerous) ovarian cells. The invention also relates to polypeptides cancerous) ovarian cells. The invention also relates to polypeptides conceded by the markers, antibodies that selectively bind to the corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer complementary to a marker of the patient afflicted with ovarian cancer complementary to a marker of the patient antiense oligonucleotide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a control non-ovarian cancer sample. A difference between the corresponds to a secreted procession of the marker in a control non-ovarian cancer. The level of expression of a compared to the presence in the sample, a protein or protein cancer is assessed by detecting the presence in the sample, a protein or protein fragment is detected using an antibody that specifically binds with the corresponding to the marker. The level of expression of the marker is assessed by detecting the presence of a transcribed corresponding to the marker or anneals with a portion of the polymucleotide which anneals with the marker or anneals with a protein or protein or protein fragment is also marker in a protein or protein or protein fragment is an experience of a transcribed corresponding the marker or anneals with a portion of control or marker is a second for monitoring the presence or anneals with a portion of control or marker is a second for monitoring the presence or anneals with a portion of control or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or protein or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the
                                                                                                     Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acid markers which are overexpressed in

The invention comprises the amino acid and coding sequences of human proteins that are associated with cell growth, differentiation, and death (CGDD). The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of CGDD, such as: cell proliferative disorders (e.g. arteriosclerosis, atheroscierosis, bursitis, cirrhosis, hepatitis, olycythaemia vera, psoriasis and cancers), developmental disorders (e.g. polycythaemia vera, psoriasis and cancers), developmental disorders (e.g. cuplepsy, stroke, Alzheimar's disease, Pick's disease, Huntington's disease, Parkinson's disease, pick's disease, Huntington's contact dermaititis and diabetes mellitus), and reproductive disorders (e.g. infertility, endometriosis and uterine fibroid). The present DNA sequence encodes a human CGDD-associated protein of the invention.
                                                                             ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. ESTs equences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

```
The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             - isolated

interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and lung cancer
                                                                                                                                                                            Sequence 804 BP; 208 A; 172 C; 188 G; 222 T; 0 U; 14 Other;
